TLC 2.0 Known Issues

The system currently requires an unambiguous General Ledger account code structure (i.e. no two code elements of the same type and length next to one another). This is excessively strict and should be relaxed even though the 'hit-rate' of recognizing default element values will be reduced.

General Ledger account codes can currently consist only of the basic English digits (0-9) and letters (a-z and A-Z). This should be improved to allow any valid digits or letters.
